Websecurity

DriveLock Websecurity – cloud based internet security

- + URL protection: local and network independent real-time protection
- + Easy to manage in the DriveLock Management Console
- + Use of industry-leading web filtering functions
- + Categorization of URLs in **CYREN** data centers (worldwide)
- + Fast system – User won't notice a delay
- + Detailed reporting, overview of threats blocked

DriveLock Websecurity – cloud based internet security

With the increasing use of new technologies, security infrastructures and mobile workers can no longer keep pace resulting in an ever expanding security gap. This can result in cyber criminals, developers of malicious software and hackers being able to engage quickly to exploit this gap.

They know that some companies often do not have access to the technology, the resources and the tools that are used for example in big enterprises to prevent security risks from the Internet. Phishing URL's for example have increased in recent years by 264% with an increase of 131% for web malware also recorded (CYREN). Many companies lack the specific skills and out of the box solutions that are needed to fill this gap today.

DriveLock offers easy to implement protection

DriveLock Websecurity, powered by **CYREN**, closes this security gap. DriveLock Websecurity uses the CYREN GlobalView™ cloud which processes over 13 billion transactions both regionally as well as internationally daily, protecting more than 550 million users in 190 countries against internet threats. Within a few seconds of the first occurrence, relationships can be identified, threats discovered and your endpoints are then protected in real time.

So you can – by securing computer desktops and laptops of your employees worldwide -protect sensitive company data and meet compliance requirements without difficulty. DriveLock Websecurity operates as protection between users and Internet.

References

The protection exists regardless of whether the user is on the corporate network located behind the firewall or on the road using an unprotected public hotel-WiFi. With the URL protection you can block connections to phishing or other criminal sites and prevent infection or even the loss of passwords, login information or sensitive documents.

Control of security and compliance

The policies can be set based on devices, users, group membership, time of day or locations. By default DriveLock Websecurity offers 64 URL categories which you can conveniently customize in Black-/Whitelists to your specific business needs. This allows you to selectively block certain sites, eg. harmful sites for (young) trainees, or websites which are only accessible at certain times of the day, eg. shopping sites only during the lunch break.

Protect all devices of your employees at any location, all with the same guidelines for your company. Centralized reporting ensures easy management. These settings can be adjusted in a few minutes in the DriveLock Management Console.

Test the industry-leading security technology DriveLock Websecurity, powered by **CYREN**, which offers the highest level of threat detection and security. The global data center of CYREN works so fast and with low latency, the user won't notice a delay.
